1. What is JavaServer Pages?

- JavaServer Pages (JSP) is a technology for developing Webpages that supports dynamic content.
- This helps developers insert java code in HTML pages by making use of special JSP tags, most of which start with `<%` and end with `%>`.
- A JavaServer Pages component is a type of Java servlet that is designed to fulfill the role of a user interface for a Java web application. Web developers write JSPs as text files that combine HTML or XHTML code, XML elements, and embedded JSP actions and commands.

2. Why Use JSP?

- Performance is significantly better because JSP allows embedding Dynamic Elements in HTML Pages itself instead of having separate CGI files.
- JSP are always compiled before they are processed by the server unlike CGI/Perl which requires the server to load an interpreter and the target script each time the page is requested.
- JavaServer Pages are built on top of the Java Servlets API, so like Servlets, JSP also has access to all the powerful Enterprise Java APIs, including **JDBC**, **JNDI**, **EJB**, **JAXP**, etc.

2. Advantages of JSP

- vs. Active Server Pages (ASP)
- vs. Pure Servlets
- vs. Server-Side Includes (SSI)
- vs. JavaScript
- vs. Static HTML

5

3. Build web by Java

- Servlet: handling, business
- JSP: presentation
- Model View Controller (MVC)
 - Servlet: Controller
 - JSP: View

6

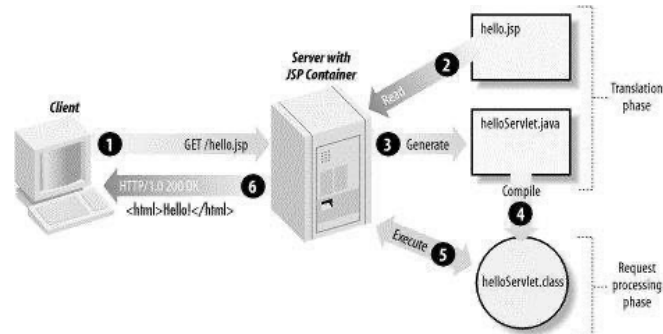

4. JSP - Architecture

- The web server needs a JSP engine, i.e, a container to process JSP pages.
- The JSP container is responsible for intercepting requests for JSP pages.
- A JSP container works with the Web server to provide the runtime environment and other services a JSP needs

4. JSP - Architecture

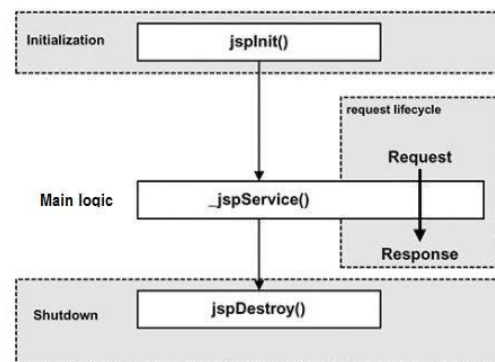

4. JSP Processing

9

5. Life Cycle

Trương Phước Lộc – tploc@fit.hcmus.edu.vn

10

5. Life Cycle

- **Compilation**
 - If the page has never been compiled, or if the JSP has been modified since it was last compiled, the JSP engine compiles the page.
- **Initialization**
 - When a container loads a JSP it invokes the **jspInit()** method before servicing any requests.
 - Initialization is performed only once
- **Execution**
 - This phase of the JSP life cycle represents all interactions with requests until the JSP is destroyed.
- **Cleanup**
 - When a JSP is being removed from use by a container.
